Higher-order derivatives

$f: I \rightarrow \mathbb{R}$, $f \in D(I)$, $f': I \rightarrow \mathbb{R}$

If $f' \in D(I)$, we get a new function $(f')': I \rightarrow \mathbb{R}$, called the second derivative of f , denoted

Def. 31.14 By induction, if the derivative $f^{(n-1)}(x)$ of order $n-1$ of f has been defined, then the derivative of order n is defined by . Denoted

If f has derivative of order n on I , we write

<u>Examples</u>	$f(x)$	$f'(x)$	$f''(x)$	$f^{(n)}(x)$
	a^x	$a^x \log a$		
	x^α	$\alpha x^{\alpha-1}$		
	$\log x$	x^{-1}		

Examples

Example 1 (Leibniz' formula) Let $f, g \in D^{(n)}(I), n \in \mathbb{N}$.

Then $(f \cdot g)^{(n)}(x) =$, where $\binom{n}{k} =$

Proof. (Exercise) By induction: $n=1$ follows from Thm 28.3

Induction step: suppose $(f \cdot g)^{(n-1)} = \sum_{k=0}^{n-1} \binom{n-1}{k} f^{(k)} \cdot g^{(n-1-k)}$

$$\text{Then } (f \cdot g)^{(n)}(x) = \left(\sum_{k=0}^{n-1} \binom{n-1}{k} f^{(k)} \cdot g^{(n-1-k)} \right)' = \sum_{k=0}^{n-1} \binom{n-1}{k} \left(f^{(k+1)} g^{(n-1-k)} + f^{(k)} g^{(n-k)} \right) = \dots \blacksquare$$

Example 2 Consider $P_n(x) =$, $c_k \in \mathbb{R}, k \in \{0, \dots, n\}$

$$P_n(0) = ; P_n'(x) = \Rightarrow$$

$$P_n''(x) = \Rightarrow$$

$$P_n^{(3)}(x) = 3 \cdot 2 \cdot c_3 + 4 \cdot 3 \cdot 2 \cdot x + \dots + n(n-1)(n-2)c_n x^{n-3} \Rightarrow P_n^{(3)}(0) = 3! c_3$$

$$\forall k \in \{0, \dots, n\} \quad P_n^{(k)}(0) = \Rightarrow P_n(x) = P_n(0) + \frac{P_n^{(1)}(0)}{1!} x + \frac{P_n^{(2)}(0)}{2!} x^2 + \dots + \frac{P_n^{(n)}(0)}{n!} x^n$$

Taylor's formula

Let $x_0 \in \mathbb{R}$. Consider polynomial

$$P_n(x_0; x) = c_0 + c_1(x - x_0) + c_2(x - x_0)^2 + \cdots + c_n(x - x_0)^n$$

Then

$$P_n(x_0; x) = P_n(x_0; x_0) + \frac{P'(x_0; x_0)}{1!}(x - x_0) + \frac{P''(x_0; x_0)}{2!}(x - x_0)^2 + \cdots + \frac{P^{(n)}(x_0; x_0)}{n!}(x - x_0)^n$$

Def. 31.15 Let $f: I \rightarrow \mathbb{R}$, f has derivatives up to order n at $x_0 \in I$. Then we call the polynomial

the Taylor polynomial of order n of $f(x)$ at x_0 . We call
the function

in Taylor's formula

$$f(x) = f(x_0) + \frac{f'(x_0)}{1!}(x - x_0) + \frac{f''(x_0)}{2!}(x - x_0)^2 + \cdots + \frac{f^{(n)}(x_0)}{n!}(x - x_0)^n + R_n(x_0; x)$$

Taylor's Theorem

Thm 31.16 Let $x, x_0 \in \mathbb{R}$, let $I(\bar{I})$ be open (closed) interval with end points x and x_0 . Let

Then for any function
there exists s.t.

$$, \forall x \in I$$

$$R_n(x_0; x) =$$

Cor 31.17 (Cauchy's form of the remainder term)

If we take $\varphi(t) =$, $\varphi'(t) = -1$ and $R_n(x_0; x) =$

Cor 31.3 (Lagrange's form of the remainder term)

If we take $\varphi(t) =$ $\varphi'(\xi) =$ $, R_n(x_0; x) =$

Taylor's Theorem

Proof. Consider function $F(t) =$

$$F(t) = f(x) - \left[f(t) + \frac{f'(t)}{1!}(x-t) + \cdots + \frac{f^{(n)}(t)}{n!}(x-t)^n \right] \Rightarrow$$

By Cauchy's theorem $\exists \xi \in I$ s.t.

$$F(x) = 0, F(x_0) =$$

$$\Rightarrow R_n(x_0; x) =$$

$$F'(t) = -\left[f'(t) - \frac{f'(t)}{1!} + \frac{f''(t)}{1!}(x-t) - \frac{f''(t)}{1!}(x-t) + \frac{f^{(3)}(t)}{2!}(x-t)^2 - \cdots + \cdots \right.$$

$$-\frac{f^{(k)}(t)}{(k-1)!}(x-t)^{k-1} + \frac{f^{(k+1)}(t)}{k!}(x-t)^k - \cdots + \cdots - \frac{f^{(n)}(t)}{(n-1)!}(x-t)^{n-1} + \frac{f^{(n+1)}(t)}{n!}(x-t)^n \right]$$

$$\left(\frac{f^{(k)}(t)}{k!}(x-t)^k \right)' = -\frac{f^{(k)}(t)}{(k-1)!}(x-t)^{k-1} + \frac{f^{(k+1)}(t)}{k!}(x-t)^k =$$

Examples

|E 16 Take $f(x) = e^x$, $x \in \mathbb{R}$. Then for $x_0 = 0$ Taylor's formula gives $e^x =$

with the remainder (Lagrange's form)

$$R_n(0; x) = \dots, \text{ where}$$

Thus $|R_n(0; x)| =$

For any $x \in \mathbb{R}$

$$\lim_{n \rightarrow \infty} R_n(0; x) = 0 \quad (\text{IE 7}), \text{ so } \lim_{n \rightarrow \infty} R_n(0; x) =$$

$$-R_n(0; x) = \sum_{k=0}^n \frac{x^k}{k!} - e^x \Rightarrow \forall x \in \mathbb{R}$$

$$\text{In particular, } e = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n \quad (0! = 1)$$

Examples

IE 17 Take $f(x) = \sin(x)$, $x \in \mathbb{R}$. Then $f^{(n)}(x) = \sin\left(x + \frac{\pi}{2}n\right)$,
and the remainder in Lagrange's form for $x_0 = 0$ is

$$|R_n(0; x)| = \left| \frac{1}{(n+1)!} \sin\left(\xi + \frac{\pi(n+1)}{2}\right) x^{n+1} \right| \leq \frac{|x|^{n+1}}{(n+1)!} \rightarrow 0, \quad n \rightarrow \infty$$

Therefore, $\forall x \in \mathbb{R} \quad \sin x =$

$$\sin^{(n)}(0) = \sin\left(\frac{\pi n}{2}\right) = \begin{cases} 0, & n = 2k \\ 1, & n = 4k+1 \\ -1, & n = 4k-1 \end{cases}$$

Similarly,

$$\forall x \in \mathbb{R} \quad \cos(x) =$$

Examples

|E 18 Take $f(x) = \dots$, $x \in (-1, 1]$. $f^{(n)}(x) = \dots$

Then the remainder in Lagrange's form for $x_0 = 0$ is

$$R_n(0; x) =$$

If $x \in (0, 1]$, $\xi \in (0, x)$, $0 < \frac{x}{1+\xi} < x \leq 1$, so $R_n(0, x) \rightarrow 0$, $n \rightarrow \infty$

If $x \in (-1, 0)$, $\xi \in (x, 0)$, $\left| \frac{x}{1+\xi} \right|$ is not necessarily less than 1

Remainder in Cauchy's form gives

$$R_n(0; x) =$$

$$0 < \frac{\xi - x}{1 + \xi} = \frac{\xi}{1 + \xi} - \frac{x}{1 + \xi} < 1 \Rightarrow R_n(0; x) \rightarrow 0, n \rightarrow \infty$$

$$\Rightarrow \forall x \in (-1, 1] \quad \log(1+x) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} =$$
